HCV NS-3 Serine Protease InhibitorsTechnical Field

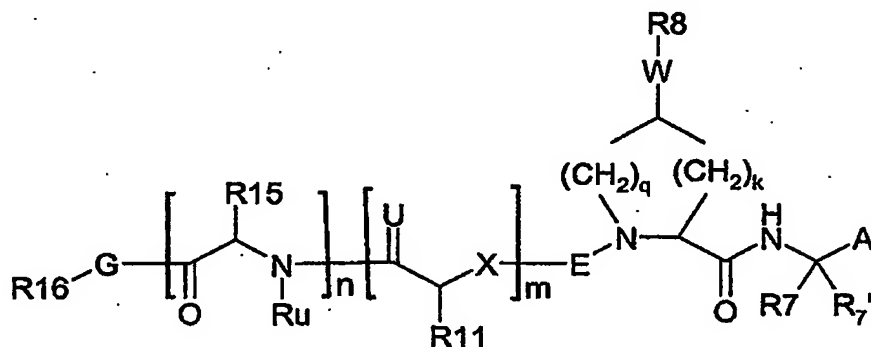

This invention relates to novel inhibitors of the NS3 serine protease of the flavivirus HCV and to methods for their use in the treatment or prophylaxis of HCV.

Background Art

The NS3 serine protease of HCV is a multifunctional protein which contains a serine protease domain and a RNA helicase domain. The protease cofactor NS4A, which is a relatively small protein, is absolutely required for enhanced serine protease activity. The NS3 serine protease is essential in the viral lifecycle. From analysis of the substrate binding site as revealed by X-ray crystal structure, it has been shown that the binding site of the NS3 protease is remarkably shallow and solvent exposed making small molecule inhibitor design a challenge.

Without in any way wishing to be bound by theory, or the ascription of tentative binding modes for specific variables, the notional concepts P1, P2, P3 and P4 as used herein are provided for convenience only and have substantially their conventional meanings and denote those portions of the inhibitor believed to fill the S1, S2, S3 and S4 subsites respectively of the enzyme, where S1 is adjacent the cleavage site and S4 remote from the cleavage site. Regardless of binding mode, the components defined by Formula I, VI etc are intended to be within the scope of the invention. For example it is expected that capping group  $R^{16}$ -G may interact with the S3 and S4 subsites.

15

The compounds of the present invention, can be briefly represented as  $R^{16}$ -G-P4-P3-link-P2-P1, wherein P3 and/or P4 may be absent, and P1, P3 and P4 each represents a building block constituted of a derivative of a natural or unnatural amino acid, P2 is a cyclic residue and G and  $R^{16}$  are capping groups. The link is a carbonyl or other function as defined for E. The P1 and P2 building blocks and the P3 and P4 building blocks are thus typically linked together by amide bonds whereas the P2 and P3 building blocks are linked through the above described link. The amide bonds are thereby typically reversed relative to each other on each side of the link in the compounds of the invention

Synthesis of the compounds of the present invention can be performed by different  
20 chemical strategies in solution or solid phase or a combination of both. The suitably protected individual building blocks can first be prepared and subsequently coupled together i.e.  $P2+P1 \rightarrow P2-P1$ . Alternatively, precursors of the building blocks can be coupled together and modified at a later stage of the synthesis of the inhibitor sequence. Further building blocks, precursors of building blocks or prefabricated  
25 bigger fragments of the desired structure, can then be coupled to the growing chain, e.g.  $R^{16}-G-P3+ E-P2-P1 \rightarrow R^{16}-G-P3-P2-P1$  or  $R^{16}-G-P4-P3+E-P2-P1 \rightarrow R^{16}-G-P4-P3-E-P2-P1$ .

Coupling between two amino acids, an amino acid and a peptide, or two peptide  
30 fragments can be carried out using standard coupling procedures such as the azide method, mixed carbonic-carboxylic acid anhydride (isobutyl chloroformate) method,

carbodiimide (dicyclohexylcarbodiimide, diisopropylcarbodiimide, or water-soluble carbodiimide) method, active ester (p-nitrophenyl ester, N-hydroxysuccinic imido ester) method, Woodward reagent K-method, carbonyldiimidazole method, phosphorus reagents or oxidation-reduction methods. Some of these methods  
5 (especially the carbodiimide method) can be enhanced by adding 1-hydroxybenzotriazole or 4-DMAP. These coupling reactions can be performed in either solution (liquid phase) or solid phase.

More explicitly, the coupling step involves the dehydrative coupling of a free carboxyl  
10 of one reactant with the free amino group of the other reactant in the presence of a coupling agent to form a linking amide bond. Descriptions of such coupling agents are found in general textbooks on peptide chemistry, for example, M. Bodanszky, "Peptide Chemistry", 2nd rev ed., Springer-Verlag, Berlin, Germany, (1993) hereafter simply referred to as Bodanszky, the contents of which are hereby incorporated by  
15 reference. Examples of suitable coupling agents are N,N'-dicyclohexylcarbodiimide, 1-hydroxybenzotriazole in the presence of N,N'-dicyclohexylcarbodiimide or N-ethyl-N'-[(3-dimethylamino) propyl] carbodiimide. A practical and useful coupling agent is the commercially available (benzotriazol-1-yloxy) tris-(dimethylamino) phosphonium hexafluorophosphate, either by itself or in the presence of 1-hydroxybenzotriazole or  
20 4-DMAP. Another practical and useful coupling agent is commercially available 2-[(1H-benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium tetrafluoroborate. Still another practical and useful coupling agent is commercially available O-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate.

25 The coupling reaction is conducted in an inert solvent, e. g. dichloromethane, acetonitrile or dimethylformamide. An excess of a tertiary amine, e. g. diisopropylethylamine, N-methylmorpholine, N-methylpyrrolidine or 4-DMAP is added to maintain the reaction mixture at a pH of about 8. The reaction temperature usually ranges between 0 °C and 50 °C and the reaction time usually ranges between 15  
30 min and 24 h.

The functional groups of the constituent amino acids generally must be protected during the coupling reactions to avoid formation of undesired bonds. The protecting groups that can be used are listed in Greene, "Protective Groups in Organic Chemistry", John Wiley & Sons, New York (1981) and "The Peptides: Analysis, Synthesis, Biology", Vol. 3, Academic Press, New York (1981), hereafter referred to simply as Greene, the disclosures of which are hereby incorporated by reference.

The  $\alpha$ -carboxyl group of the C-terminal residue is usually protected as an ester that can be cleaved to give the carboxylic acid. Protecting groups that can be used include 1) alkyl esters such as methyl, trimethylsilyl and t.butyl, 2) aralkyl esters such as benzyl and substituted benzyl, or 3) esters that can be cleaved by mild base or mild reductive means such as trichloroethyl and phenacyl esters.

The  $\alpha$ -amino group of each amino acid to be coupled must be protected. Any protecting group known in the art can be used. Examples of such groups include: 1) acyl groups such as formyl, trifluoroacetyl, phthalyl, and p-toluenesulfonyl; 2) aromatic carbamate groups such as benzyloxycarbonyl (Cbz or Z) and substituted benzyloxycarbonyls, and 9-fluorenylmethyloxycarbonyl (Fmoc); 3) aliphatic carbamate groups such as tertbutyloxycarbonyl (Boc), ethoxycarbonyl, diisopropylmethoxycarbonyl, and allyloxycarbonyl; 4) cyclic alkyl carbamate groups such as cyclopentyloxycarbonyl and adamantyloxycarbonyl; 5) alkyl groups such as triphenylmethyl and benzyl; 6) trialkylsilyl such as trimethylsilyl; and 7) thiol containing groups such as phenylthiocarbonyl and dithiasuccinoyl. The preferred  $\alpha$ -amino protecting group is either Boc or Fmoc. Many amino acid derivatives suitably protected for peptide synthesis are commercially available.

The  $\alpha$ -amino protecting group is cleaved prior to the next coupling step. When the Boc group is used, the methods of choice are trifluoroacetic acid, neat or in dichloromethane, or HCl in dioxane or in ethyl acetate. The resulting ammonium salt is then neutralized either prior to the coupling or in situ with basic solutions such as aqueous buffers, or tertiary amines in dichloromethane or acetonitrile or

dimethylformamide. When the Fmoc group is used, the reagents of choice are piperidine or substituted piperidine in dimethylformamide, but any secondary amine can be used. The deprotection is carried out at a temperature between 0 °C and room temperature usually 20-22 °C.

5

Any of the natural or non-natural amino acids having side chain functionalities will typically be protected during the preparation of the peptide using any of the above described groups. Those skilled in the art will appreciate that the selection and use of appropriate protecting groups for these side chain functionalities depend upon the amino acid and presence of other protecting groups in the peptide. In the selection of such protecting groups it is desirable that the group is not removed during the deprotection and coupling of the  $\alpha$ -amino group.

10

For example, when Boc is used as the  $\alpha$ -amino protecting group, the following side chain protecting groups are suitable: p-toluenesulfonyl (tosyl) moieties can be used to protect the amino side chain of amino acids such as Lys and Arg; acetamidomethyl, benzyl (Bn), or tert-butylsulfonyl moieties can be used to protect the sulfide containing side chain of cysteine; benzyl (Bn) ethers can be used to protect the hydroxy containing side chains of serine, threonine or hydroxyproline; and benzyl esters can be used to protect the carboxy containing side chains of aspartic acid and glutamic acid.

15

20

When Fmoc is chosen for the  $\alpha$ -amine protection, usually tert. butyl based protecting groups are acceptable. For instance, Boc can be used for lysine and arginine, tert.butyl ether for serine, threonine and hydroxyproline, and tert-butyl ester for aspartic acid and glutamic acid. Triphenylmethyl (Trityl) moiety can be used to protect the sulfide containing side chain of cysteine.

25

30

Once the inhibitor sequence is completed any protecting groups are removed in whatever manner is dictated by the choice of protecting groups. These procedures

are well known to those skilled in the art.

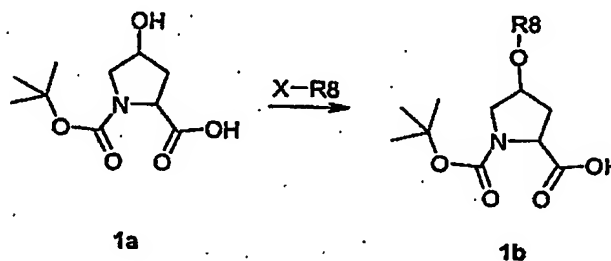

In compounds of Formula I, the P2 unit comprises a nitrogen-containing ring residue which is substituted with the W and R<sup>8</sup> moieties.

#### Synthesis of heterocyclic P2 building blocks

Compounds wherein W is O and R<sup>8</sup> is alkyl, C<sub>0</sub>-C<sub>3</sub> carbocyclyl, C<sub>0</sub>-C<sub>3</sub>-heterocyclyl can be prepared according to the procedure described by E. M. Smith et al. (J. Med. Chem. (1988), 31, 875-885), as depicted in Scheme 1, which illustrates the technique in a moiety wherein q and k are 1.

10

Scheme 1

Commercially available Boc-4-(R)-hydroxyproline, or any suitable hydroxy substituted proline analogue, such as an hydroxypiperidoic acid is treated with a base such as sodium hydride or potassium t.butoxide in a solvent like dimethylformamide and the resulting alkoxide is reacted with an alkylating agent, R<sup>8</sup>-X, wherein X is a suitable leaving group such as a halide like chloride, bromide or iodide, providing the desired substituted proline derivative.

15

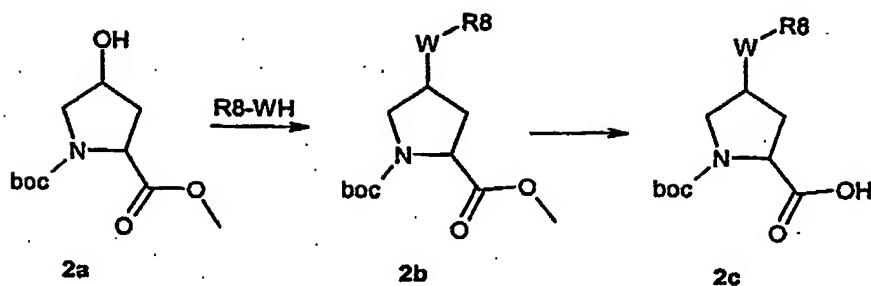

20

Alternatively, when W is O or S and R<sup>8</sup> is carbocyclyl such as phenyl or heterocyclyl such as heteroaryl, the P2 building blocks can also be prepared via a Mitsunobu reaction (Mitsunobu, 1981, Synthesis, January, 1-28; Rano et al., Tetrahedron Lett., 1995, 36, 22, 3779-3792; Krchnak et al., Tetrahedron Lett., 1995, 36, 5, 6193-6196; Richter et al., Tetrahedron Lett., 1994, 35, 27, 4705-4706) as shown in Scheme 2, which illustrates the technique in a moiety wherein q and k are 1.

- 5 Treatment of the appropriate hydroxy substituted proline analogue, such as a hydroxypiperidoic acid, here shown as commercially available Boc-4-hydroxyproline methyl ester, with the desired alcohol or thiol (R<sup>8</sup>-WH) in the presence of triphenylphosphine and an activating agent like diethyl azodicarboxylate (DEAD), diisopropyl azodicarboxylate (DIAD) or the like, provides the ester compound (2b).
- 10 Hydrolysis of the ester to the acid by standard procedures provides the P2 building block (2c).

- 15 Alcohol (2a) can alternatively be treated with phosgene thus providing the corresponding chloroformate which upon reaction with an amine, R<sup>8</sup>NH<sub>2</sub>, in the presence of a base like sodium hydrogen carbonate or triethylamine, provides carbamates i.e. W is -OC(=O)NH-, whereas reaction of alcohol (2a) with an acylating agent, R<sup>8</sup>-CO-X, like an acid anhydride or acid halide for instance the acid chloride, to provide esters, i.e. W is -OC(=O)-.

- 20 Various alcohols R<sup>8</sup>-OH, and alkylating agents R<sup>8</sup>-X are described in WO 00/09543 and WO00/59929. An example of the synthesis wherein R<sup>8</sup> is a substituted quinoline derivative is shown in Scheme 3.

Friedel-Craft acylation of a suitable substituted aniline (3a), available either  
 5 commercially or in the literature, using an acylating agent like acetyl chloride or the  
 like in the presence of boron trichloride and aluminium trichloride in a solvent like  
 dichloromethane provides (3b). Coupling of (3b) to a heterocyclic carboxylic acid (3c)  
 under basic conditions, such as in pyridine, in the presence of an activating agent for  
 the carboxylate group, for instance  $\text{POCl}_3$ , followed by ring closure and dehydration  
 10 under basic conditions like potassium *tert*.butoxide in *tert*.butanol provides quinoline  
 derivative (3e). Quinoline derivative (3e) can be coupled in a Mitsunobu reaction to  
 an alcohol as described above, or the hydroxy group can be displaced by a suitable  
 leaving group such as a halide like chloride, bromide or iodide, by treatment of  
 quinoline (3e) with an appropriate halogenating agent for example phosphoryl  
 15 chloride or the like.

A variety of carboxylic acids with the general structure (3c) can be used in Scheme  
 3. These acids are available either commercially or in the literature. An example of  
 the preparation of 2-(substituted)-amino-carboxy-aminothiazole derivatives, following  
 20 the procedure by Berdikhina et al. *Chem. Heterocycl. Compd. (Engl. Transl.)* (1991),

- Thiourea (4c) with different alkyl substituents  $\text{R}'$  can be formed by reaction of the appropriate amine (4a) with tert-butylisothiocyanate in the presence of a base like diisopropylethylamine in a solvent like dichloromethane followed by removal of the tert. butyl group under acidic conditions. Subsequent condensation of thiourea derivative (4c) with 3-bromopyruvic acid provides the acid (4d).
- P2 building blocks wherein the  $\text{R}^8$  substituent is attached via a nitrogen atom i.e. W is amine, amide or sulphonamide, can be prepared from aminoproline analogues achieved either from a suitable commercially available aminoproline, etc derivative or by transforming the hydroxy group of the corresponding hydroxy derivative into an azide group for example by transforming the hydroxy group into a suitable leaving group such as a mesylate or halogen like chloride, followed by substitution of the leaving group with azide or by the use of an azide transfer agent like diphenylphosphoryl azide (DPPA). Reduction of the azide by catalytic hydrogenation or any other suitable reduction method provides the amine. The amino derivative can be reacted with an alkylating agent of the general formula  $\text{R}^8-\text{X}$  wherein  $\text{R}^8$  and X are as described for scheme 1, to form compounds wherein W is  $-\text{NH}-$ . Reaction of the aminoproline analogue with an acid of the general formula  $\text{R}^8-\text{COOH}$  under standard amide coupling conditions provides compounds wherein W is  $-\text{NHC}(=\text{O})-$ , whereas reaction of the aminoproline analogue with an appropriate derivative of sulphonic acid,  $\text{R}^8-\text{S}(\text{O})_2-\text{X}$  where X is a leaving group for example chloride, in the presence of a base, provides sulphonamides. It will be apparent that corresponding reactions will be available for P2 groups with other ring sizes and substitution pattern.

36

4-Substituted heterocyclyl derivatives such as 4-substituted proline for use as P2 building blocks where W is -CH<sub>2</sub>- can be prepared as shown in Scheme 5, which illustrates the technique on a moiety where q and k is 1, according to the procedures described by J. Ezquerra et al., *Tetrahedron*, 1993, 38, 8665-8678 and C. Pedregal et al. *Tetrahedron Lett.*, 1994, 35, 2053-2056.

Treatment of suitably acid protected pyrrolidone or piperidinone such as commercially available Boc-pyrroglutamic acid (5a) with a strong base such as lithium diisopropylamide in a solvent like tetrahydrofuran followed by addition of an alkylating agent R<sup>8</sup>-CH<sub>2</sub>-X where X is a suitable leaving group such as a halide like chloride or bromide, followed by reduction of the amide and deprotection of the ester gives the desired compound (5d).

15

Compounds with alternative ring size and/or position of the W-R<sup>8</sup> substituent of the proline derivatives in scheme 1, 2 and 5 may also be used in the preparation of compounds according to the present invention. For example, alkylation of commercially available 3-hydroxyproline provides compounds of the general formula (I) wherein k is 0 and q is 2. Correspondingly, alkylation of 5-hydroxyproline, prepared for example as described by Hallberg et al., *J. Med. Chem.* (1999), 4524-4537, provides compounds of the general formula (I) wherein k is 2 and q is 0.

20

25

Various methods for the preparation of hydroxylated 2-piperidine carboxylic acids are described in the literature se for instance Celestini et al., *Org. Lett.*, (2002), 1367-

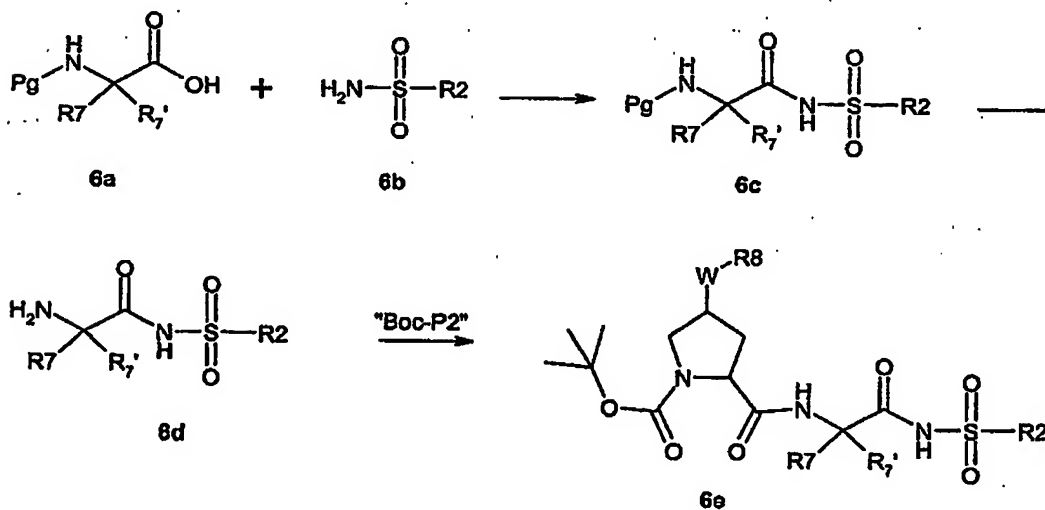

1370, Hoarau et al., *Tetrahedron: Asymmetry*, (1996), 2585-2594, Zhu et al., *Tetrahedron Lett.*, 41, (2000), 7033-7036. For example, the corresponding pyridine carboxylic acids can be reduced to provide hydroxylated 2-piperidine carboxylic acids. Enzymatical methods can also be used for the preparation of hydroxylated proline analogues. For example, a 3-hydroxy substituent can be introduced on commercially available 4, 5, and 6 membered heterocyclic acids by the use of proline 3-hydroxylase as described by Ozaki et al., *Tet. Letters*, 40, (1999), 5227-5230.

Additional P2 building blocks, especially for compounds of formula VI are described in Schemes 11-15 below.

#### Synthesis and introduction of P1 building blocks.

The amino acids used in the preparation of P1 fragments are available either commercially or in the literature, see for example WO 00/09543 and WO00/59929 from Boehringer-Ingelheim.

Scheme 6 shows an example of the preparation of a sulphonamide derivative to be used as a P1 fragment, and the subsequent coupling to a Boc protected P2 building block.

Scheme 6

The sulphonamide group can be introduced on a suitably protected amino acid (6a) by treatment of the amino acid with a coupling agent, for example N,N'-carbonyldiimidazole (CDI) or the like, in a solvent like THF followed by reaction with the desired sulphonamide (6b) in the presence of a strong base such as 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU). Alternatively the amino acid can be treated with the desired sulphonamide (6b) in the presence of a base like diisopropyl ethylamine followed by treatment with a coupling agent like PyBOP® to effect the introduction of the sulphonamide group. Removal of the amino protecting group by standard methods and subsequent coupling to a P2 building block, prepared as described above, using standard methods for amide bond formation, like with a coupling agent as O-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate (HATU) in the presence of a base such as diisopropylamine in a solvent like dimethylformamide, gives Boc protected P2-P1 construct (6e). Alternatively, the sulphonamide group can be introduced at a later stage of the synthesis, for example as the last step. In this case the carboxylic acid is appropriately protected, for example as the methyl ester, and appropriately deprotected prior to the coupling of the sulphonamide group, for example with aqueous lithium hydroxide.

P1 building blocks for the preparation of compounds according to general formula I and VI wherein A is an ester or an amide can be prepared by reacting amino acid (6a) with the appropriate amine or alcohol respectively under standard conditions for amide bond or ester formation. P1 building blocks wherein A is CR<sup>4</sup>R<sup>4'</sup> are described in Oscarsson et al Bioorg Med Chem 2003 11(13) 2955-2963 and PCT/EP03/10595 filed 23.09.2003, the contents of which are incorporated by reference.

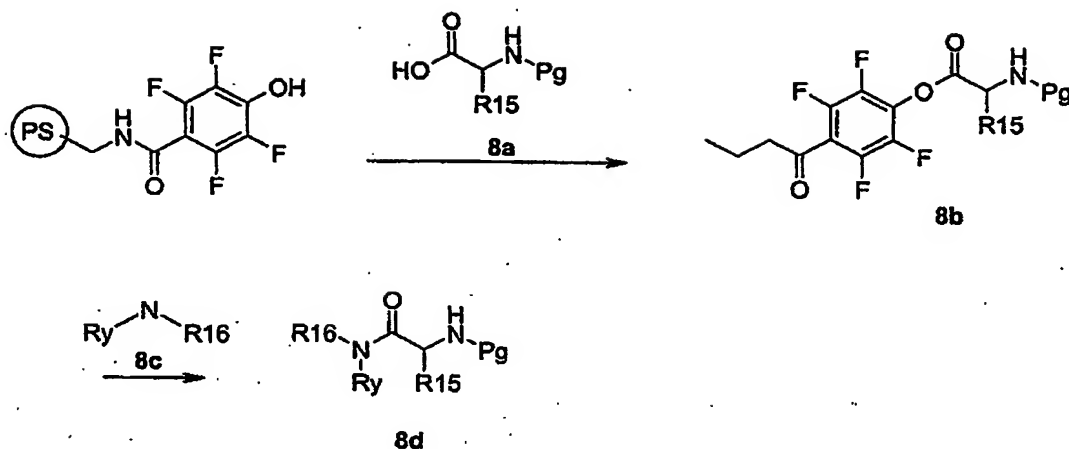

#### Synthesis of capped building blocks

The building blocks R<sup>16</sup>-G-P3 and R<sup>16</sup>-G-P4-P3 can be prepared as generally depicted in scheme 7.

M183-2

40

Scheme 8

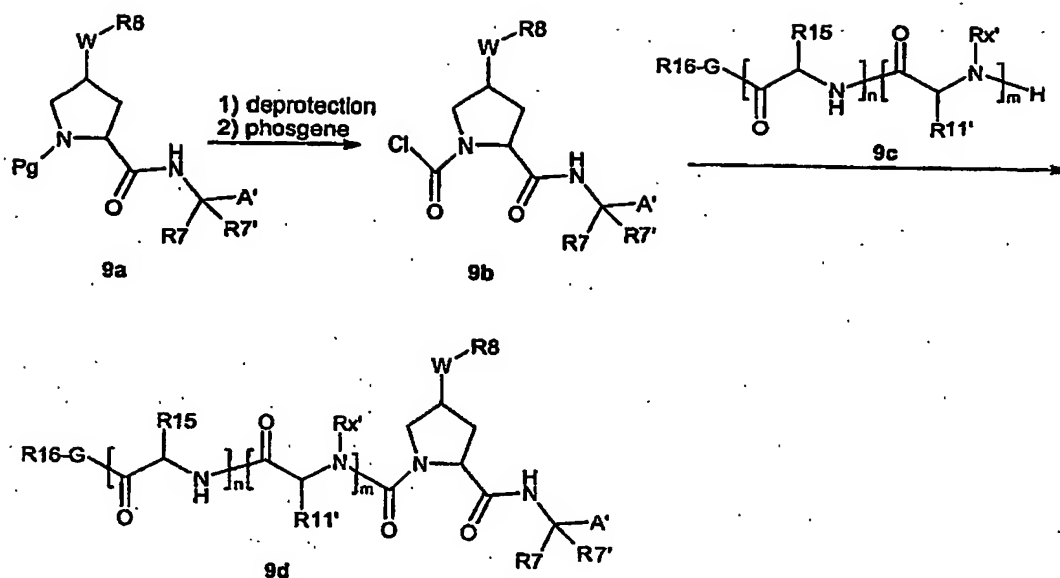

An appropriate N-protected, for example Boc protected, amino acid (8a) can be immobilized on a solid support, here exemplified by Agronaut resin PS-TFP, by reacting the amino acid with the desired solid support in the presence of coupling reagent like N,N'-diisopropylcarbodiimide and a base like DMAP in a solvent like dichloromethane and dimethylformamide. The immobilized amino acid can then be cleaved from the support with a suitable capping group (8c) thus giving fragments useful for the preparation of compounds according to the present invention wherein m or n is 1. Optionally the amino protecting group can be removed followed by coupling of an appropriate amino acid using standard methods thus providing fragments useful for the preparation of compounds according to the present invention wherein m and n are 1.

#### Coupling of a capping group or a capped building block to the P2-P1 construct

The  $R^{16}$ -G,  $R^{16}$ -G-P3 or  $R^{16}$ -G-P4-P3 building block linked via a urea functionality to the P2-P1 construct, can be introduced as depicted in scheme 9, which illustrates the technique with a variant in which P2 is a heterocyclic residue.

### Scheme 9

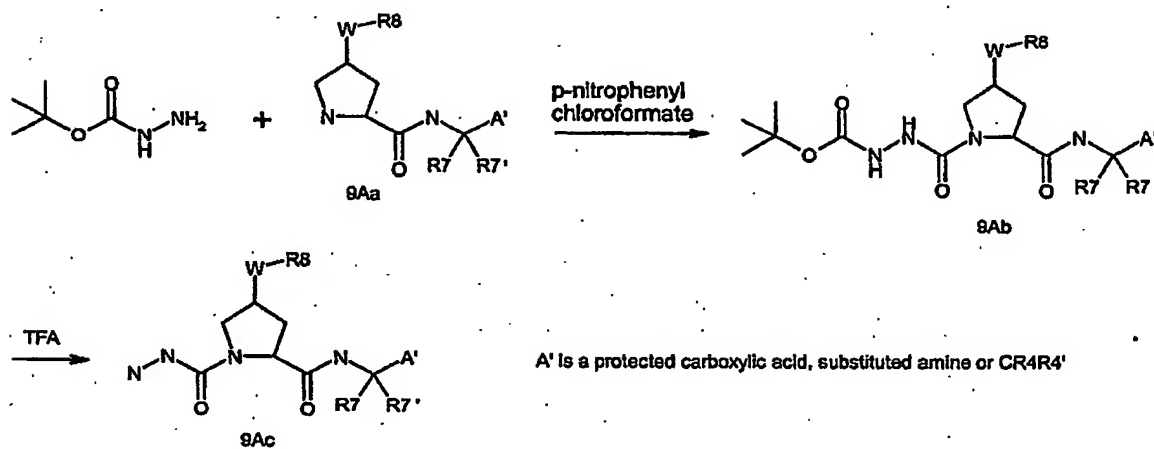

- A chlorocarbamate group can be formed onto the ring amine of the P2-P1 construct (9a) by removal of the amine protection group by standard procedures, like acidic treatment with for example TFA in dichloromethane or the like when the Boc group is used, followed by reaction of the free amine with phosgene in toluene in the presence of a base such as sodium hydrogen carbonate or triethylamine in a solvent like tetrahydrofuran. Subsequent reaction of the formed electrophilic center with the amino group of a R<sup>16</sup>-NH<sub>2</sub>, R<sup>16</sup>-NH-NH<sub>2</sub>, R<sup>16</sup>-G-P3 or R<sup>16</sup>-G-P4-P3 building block (9c) in a solvent like dichloromethane in the presence of a base like sodium hydrogen carbonate provides (9d). Compounds of general formula (I) wherein E is C=S, S(=O) or S(=O)<sub>2</sub> can be prepared according to the above procedure but with the use of reagents like thiocarbonyl diimidazole, thionyl chloride or sulphuryl chloride respectively instead of phosgene.

Reduction of the azide function for example by polymer bound triphenyl phosphine in a solvent like methanol or any other suitable reduction method provides intermediate (11d) which subsequently can be reacted with an acid under peptide coupling conditions or with an amine in a reductive amination reaction providing amides and secondary amines respectively.

Scheme 11A

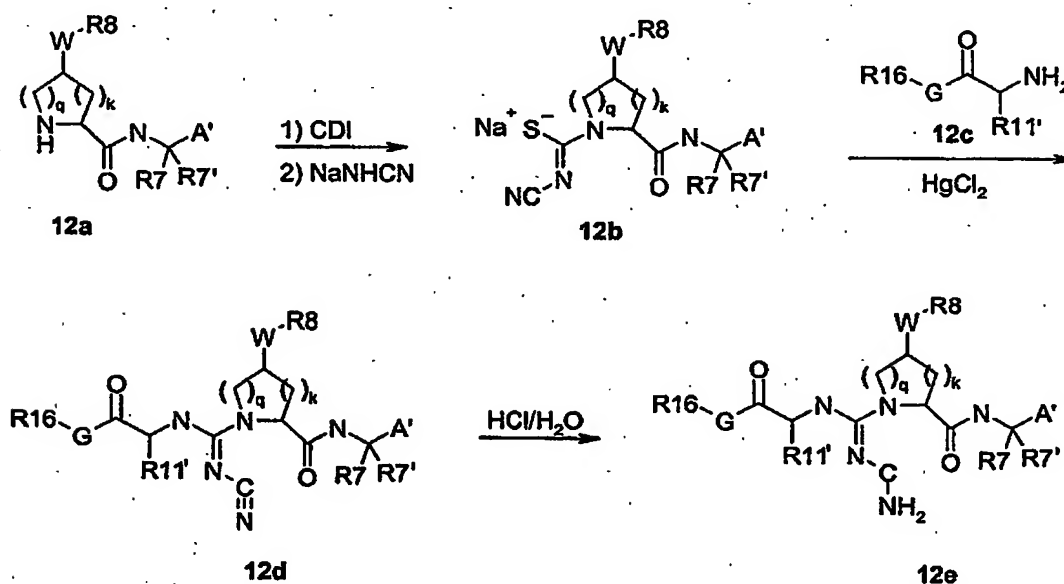

Instead of using the azide derivative (11b) in scheme 11 the corresponding, optionally protected, hydroxy derivative (11Ab) can be used in the displacement reaction with the chlorocarbamate (11Aa) and thus introducing a primary alcohol. The alcohol (11Ac) can then, after optional deprotection, be oxidized with a suitable oxidizing agent like for example Dess-Martin periodinane to form the corresponding aldehyde. Reaction of the aldehyde with a desired amine in a reductive amination reaction using a reagent like for example polystyrene bound cyanoborohydride in a solvent like THF provides amine derivatives (11Ae).

Alternatively alcohol (11Ac) can be reacted with a suitable acylating or alkylating agent under the appropriate conditions to provide ester and ether compounds respectively, i.e. G is O in general formula (I).

Subsequent reaction of the formed alcohol with a suitable acylating or alkylating agent using the appropriate conditions provides the ester and ether compounds respectively, i.e. G is O in general formula (I).

Although Figure 11 and 11 A have been described with reference to a compound of Figure 1, it will be readily apparent that corresponding methodology is applicable for compounds of the Formula VI.

## 10 Scheme 12

Other building blocks, R<sup>16</sup>-G or R<sup>16</sup>-G-P4-P3, can alternatively be coupled to the intermediate (12b). Hydrolysis of the cyano group by treatment of (12d) with diluted hydrochloric acid gives the guanidylurea derivative (12e).

opening and coupling of a P1 building block (14c) as described in scheme 13 or directly by the amine group of the P1 fragment provides (14d). Introduction of R<sup>8</sup>-substituent as described above followed by removal of the acid protection group by subjecting the ester to acidic conditions like trifluoroacetic acid and triethylsilane in a solvent like methylene chloride and finally coupling of the P3 building block (14e), P3-P4 building block or capping group R<sup>16</sup>-NHRy, as described above provides (f). When R<sup>7</sup>, R<sup>7'</sup> and A' contain functional groups, these are optionally suitably protected by methods recognized by persons skilled in the art, see for example Bodanzky or Greene cited above.

An unsaturated P2 building block towards the preparation of compounds of formula VI can be prepared as illustrated with cyclopentene below.

The cyclopentene scaffold is typically prepared as described in scheme 15.

Chem. 36 (1971) 1277-1285 followed by reduction of the keto functionality with a reduction agent like sodium borohydride provides the unsaturated hydroxy compound (15b). Selective ester hydrolysis using for example lithium hydroxide in a solvent like a mixture of dioxane and water provides hydroxy substituted cyclopentene derivative (15c).

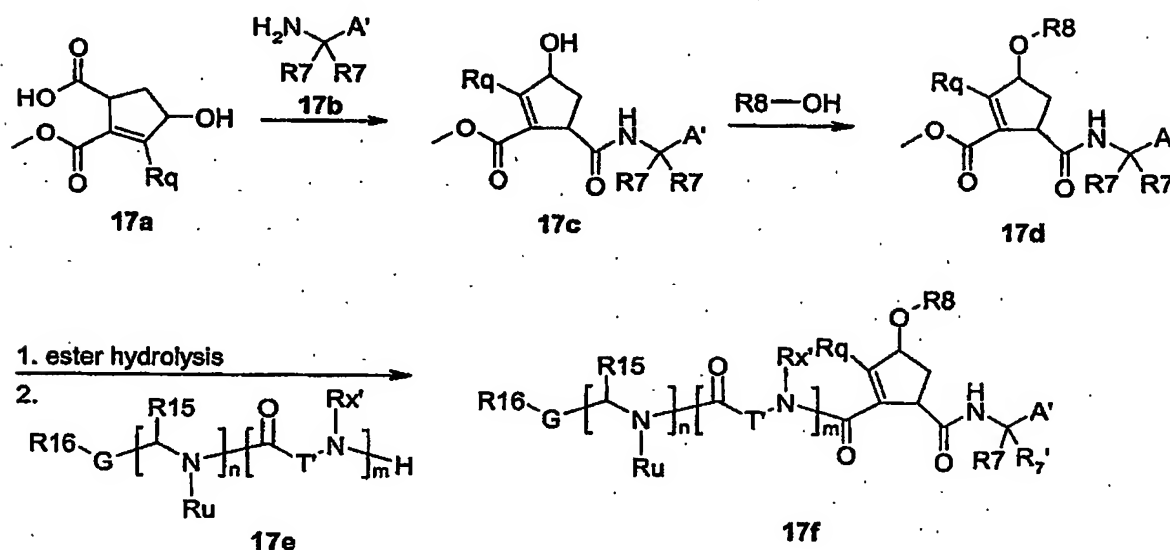

Scheme 16

- 5 Oxidation of commercially available 3-methyl-3-buten-1-ol (16a) by the use of an oxidation agent like pyridinium chlorochromate followed by treatment with acetyl chloride, bromine and methanol provides the  $\alpha$ -bromo ester (16c). The afforded ester (16c) can then be reacted with the enolate (16e), achieved for example by treatment
- 10 a solvent like tetrahydrofuran, to give the alkylated compound (16f). The tert-butyl ester (16e) can be prepared by treatment of the corresponding commercially available acid (16d) where  $k'$  is 1 to 3 with di-tert.butyl dicarbonate in the presence of a base like dimethylaminopyridine. Cyclisation of (16f) by an olefin metathesis reaction performed as described above provides cyclopentene derivative (16g).
- 15 Stereoselective epoxidation of (16g) can be carried out using the Jacobsen asymmetric epoxidation method to furnish the epoxide (16h). Finally, addition of a base like DBN (1,5-diazabicyclo-[4.3.0]non-5-ene) yields the alcohol (16i). Optionally the double bond of compound (16i) can be reduced for example by catalytic hydrogenation using a catalyst like palladium on carbon which provides the
- 20 corresponding saturated compound.

The afforded cyclic scaffolds can then be used, as described above, to complete the inhibitor sequence. An example is shown in scheme 17.

Hydrolysis of the remaining ester and subsequent amide coupling of a desired P3 or P3-P4 building block (17e) optionally followed by manipulations of the P1 part provides cyclopentene containing compounds (17f) according to general formula VI. When  $\text{R}^7$ ,  $\text{R}^{7'}$  and  $\text{A}'$  contain functional groups, these are optionally suitably protected by methods recognized by persons skilled in the art, see for example Bodanzky or Greene cited above.

Formation of macrocyclic compounds

Compounds according to the present invention wherein an alkylene chain extending from the  $R^7/R^{7'}$  cycloalkyl to  $R_x$ ,  $R_d$  or  $R^{11}$  thus forming a macrocycle, can be prepared as described below. Suitable P1, P2 and P3 building blocks, or precursors thereof, are coupled together using the strategies described above, followed by a ring-closing reaction (macrocyclization). The substituent  $W-R^8$  of the P2 building block can be incorporated via a Mitsunobu reaction as described above, before or after formation of the macrocycle or the assembly can be done with the required substituted proline analogue or carbocycle. For macrocyclic structures extending from the  $R^7/R^{7'}$  cycloalkyl to  $R^{11}$ , P3 amino acids containing the appropriate side chain can be prepared as described in WO00/59929.

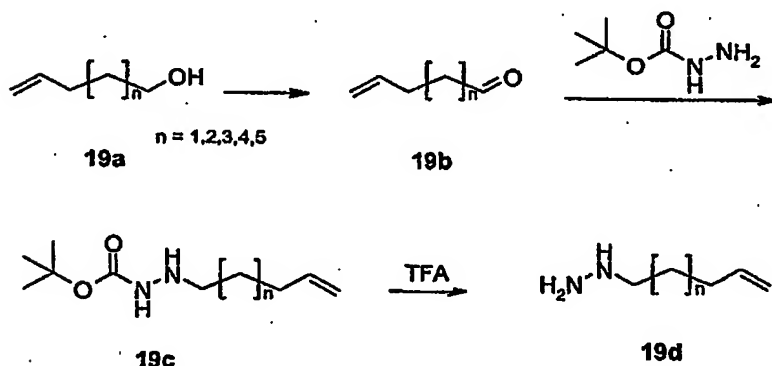

A typical route to macrocyclic compounds is shown in Scheme 18 which illustrates the technique applied to a compound having a heterocyclic P2 and a spiro-cyclopropyl P1, where the macrocycle incorporates the P3 side chain.

Scheme 18

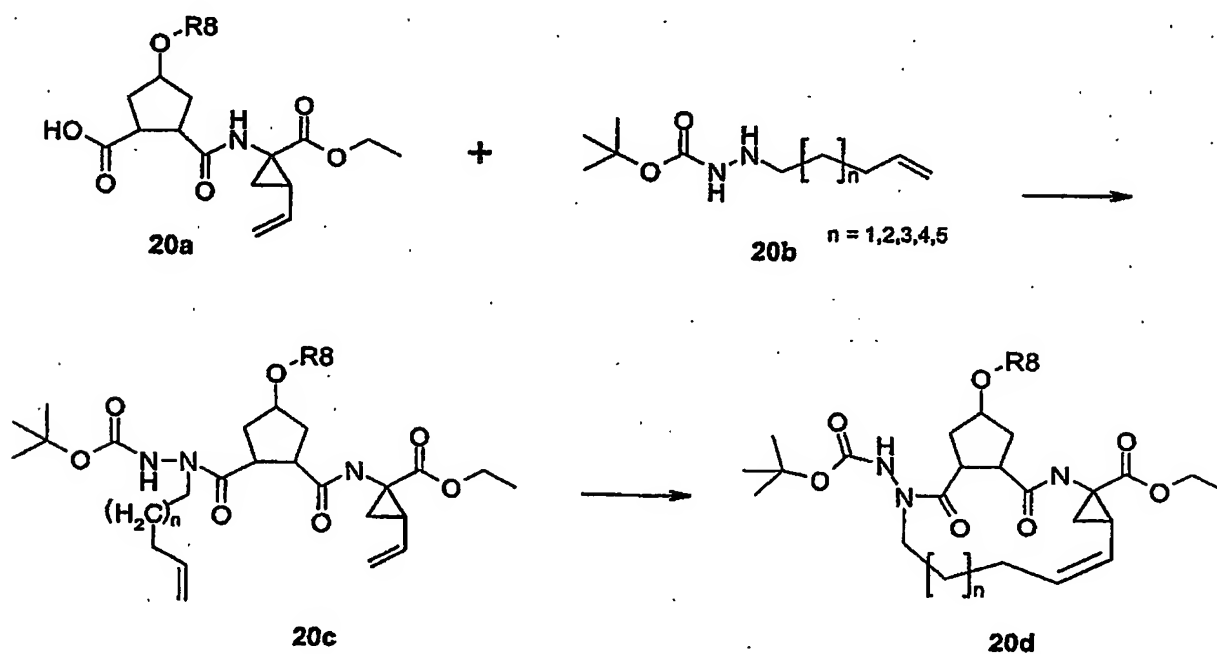

Coupling of proline derivative (18a) with the appropriate, acid protected, amino acid (18b) using the conditions described above provides (18c). Formation of the macrocycle can then be carried out via an olefin metathesis reaction using a Ru-based catalyst such as the one reported by Miller, S.J., Blackwell, H.E.; Grubbs, R.H. J. Am. Chem. Soc. 118, (1996), 9606-9614, Kingsbury, J. S., Harrity, J. P. A., Bonitatebus, P. J., Hoveyda, A. H., J. Am. Chem. Soc. 121, (1999), 791-799 and Huang et al., J. Am. Chem. Soc. 121, (1999), 2674-2678. It will also be recognized that catalysts containing other transition metals such as Mo can be used for this reaction. Optionally the double bond is reduced and/or the ethyl ester is hydrolysed by standard hydrogenation and/or hydrolysis methods respectively well known in the art. Alternatively the methyl ester can be selectively hydrolysed followed by coupling of a R<sup>16</sup>-G-P4 building block by standard peptide coupling conditions. The procedure described in Scheme 18 can also be applied to the corresponding carbocyclic analogues described above. When the linker contains a nitrogen atom the ring closure can be carried out by reductive amination as described in WO0059929.

Hydrazine containing macrocyclic structures can be prepared by the use of a carbazate derivative, N-alkylated with the appropriate chain, as the P3 building block. Alkylated carbazate derivatives can be prepared as described in Scheme 19.

Scheme 19

- Oxidation of the appropriate alcohol (19a) using a suitable oxidation method like for example with N-methyl morpholine oxide and tetrapropylammonium perruthenate in a solvent like dichloromethane provides ketone (19b). Reductive alkylation of
- 5 tert.butyl carbazate with the afforded ketone gives the P3 building block (19c) useful for the preparation of compounds wherein the macrocycle is extending from the "inner" nitrogen as shown in compounds 20c and 20d in scheme 20. Alternatively,
- any appropriate hydrazine derivative such as morpholin-1-ylamine, piperidin-1-ylamine can be used instead of tert.butyl carbazate in the reaction with aldehyde
- 10 19b. Alternatively removal of the boc group from compound 19c by standard procedures like acidic treatment with for example TFA in a suitable solvent like THF, provides building blocks useful for the preparation of compounds wherein the macrocycle is extending from the other, "outer", nitrogen of the hydrazine group .
- 15 The P3 building block can then be coupled to any of the described P2-P1 building blocks. Scheme 20 exemplifies the coupling of a hydrazine containing P3 building block to a cyclopentane scaffold followed by macrocyclisation.

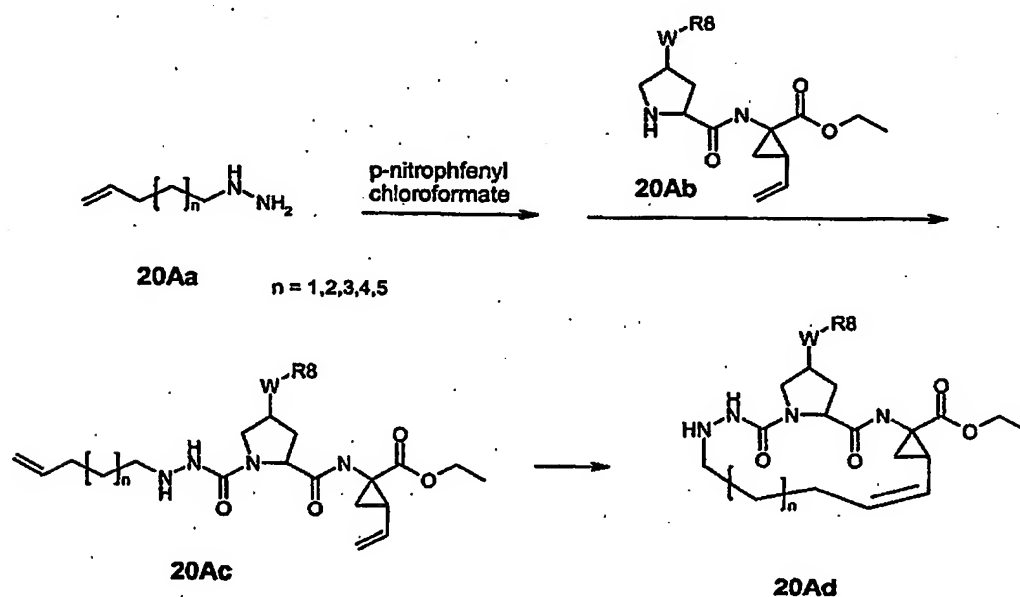

M183-2

56

## Scheme 20

Coupling of the carbazate derivative (20b) to the P2-P1 building block (20a) using standard peptide coupling conditions provides intermediate (20c). Ring closure of (20c) by an olefin metathesis reaction as described above gives the macrocyclic compound (20d).

Scheme 20A shows a route towards hydrazine containing compounds wherein the macrocycle is extending from the "outer" nitrogen. The coupling is exemplified with a 5-membered heterocyclic P2-building block.

## Scheme 20A

Coupling of the hydrazine compound described above (20Aa) to the P2 building block (20Ab) via a urea linkage can be effected for example by treatment of (20Aa) with p-nitrophenyl chlorocarbamate in a solvent like acetonitrile in the presence of a base like sodium hydrogen carbonate followed by addition of the P2-building block (20Ab) in a solvent such as acetonitrile in the presence of a base like

diisopropylamine. Ring closing methatesis of 20Ac, as described above in scheme 20, provides the macrocyclic derivative 20Ad.

The term "N-protecting group" or "N-protected" as used herein refers to those groups intended to protect the N-terminus of an amino acid or peptide or to protect an amino group against undesirable reactions during synthetic procedures. Commonly used N-protecting groups are disclosed in Greene, "Protective Groups in Organic Synthesis" (John Wiley & Sons, New York, 1981), which is hereby incorporated by reference. N-protecting groups include acyl groups such as formyl, acetyl, propionyl, pivaloyl, t-butylacetyl, 2-chloroacetyl, 2-bromoacetyl, trifluoroacetyl, trichloroacetyl, phthalyl, o-nitrophenoxycarbonyl,  $\alpha$ -chlorobutyryl, benzoyl, 4-chlorobenzoyl, 4-bromobenzoyl, 4-nitrobenzoyl, and the like; sulfonyl groups such as benzenesulfonyl, p-toluenesulfonyl, and the like, carbamate forming groups such as benzyloxycarbonyl, p-chlorobenzyloxycarbonyl, p-methoxybenzyloxycarbonyl, p-nitrobenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl, p-bromobenzyloxycarbonyl, 3,4-dimethoxybenzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitro-4,5-dimethoxybenzyloxycarbonyl, 3,4,5-trimethoxybenzyloxycarbonyl, 1-(p-biphenyl)-1-methylethoxycarbonyl,  $\alpha,\alpha$ -dimethyl-3,5-dimethoxybenzyloxycarbonyl, benzhydryloxycarbonyl, t-butoxycarbonyl, diisopropylmethoxycarbonyl, isopropylloxycarbonyl, ethoxycarbonyl, methoxycarbonyl, allyloxycarbonyl, 2,2,2-trichloroethoxycarbonyl, phenoxycarbonyl, 4-nitrophenoxycarbonyl, fluorenyl-9-methoxycarbonyl, cyclopentylloxycarbonyl, adamantylloxycarbonyl, cyclohexylloxycarbonyl, phenylthiocarbonyl, and the like; alkyl groups such as benzyl, triphenylmethyl, benzyloxymethyl and the like; and silyl groups such as trimethylsilyl and the like. Favoured N-protecting groups include formyl, acetyl, benzoyl, pivaloyl, t-butylacetyl, phenylsulfonyl, benzyl, t-butoxycarbonyl (BOC) and benzyloxycarbonyl (Cbz).

Hydroxy protecting group as used herein refers to a substituent which protects hydroxyl groups against undesirable reactions during synthetic procedures such as those O-protecting groups disclosed in Greene, "Protective Groups In Organic

Synthesis," (John Wiley & Sons, New York (1981)). Hydroxy protecting groups comprise substituted methyl ethers, for example, methoxymethyl, benzyloxymethyl, 2-methoxyethoxymethyl, 2-(trimethylsilyl)ethoxymethyl, t-butyl and other lower alkyl ethers, such as isopropyl, ethyl and especially methyl, benzyl and triphenylmethyl; 5 tetrahydropyranyl ethers; substituted ethyl ethers, for example, 2,2,2-trichloroethyl; silyl ethers, for example, trimethylsilyl, t-butyl dimethylsilyl and t-butyl diphenylsilyl; and esters prepared by reacting the hydroxyl group with a carboxylic acid, for example, acetate, propionate, benzoate and the like.

10 In treating conditions caused by flavivirus such as HCV, the compounds of formula I or VI are typically administered in an amount to achieve a plasma level of around 100 to 5000 nM, such as 300 to 2000 nM. This corresponds to a dosage rate, depending on the bioavailability of the formulation, of the order 0.01 to 10 mg/kg/day, preferably 0.1 to 2 mg/kg/day. A typical dosage rate for a normal adult will be around 15 0.05 to 5 g per day, preferably 0.1 to 2 g such as 500-750 mg, in one to four dosage units per day. As with all pharmaceuticals, dosage rates will vary with the size and metabolic condition of the patient as well as the severity of the infection and may need to be adjusted for concomitant medications.

20 As is good prescribing practice with antiviral therapy, the compounds of formula I are typically coadministered with other HCV therapies to avoid the generation of drug escape mutants. Examples of such additional HCV antiviral therapies include ribavirin, interferons, including pegylated interferons. Additionally a number of nucleoside analogues and protease inhibitors are in the development and will be 25 amenable to co-administration with the compounds of the invention.

While it is possible for the active agent to be administered alone, it is preferable to present it as part of a pharmaceutical formulation. Such a formulation will comprise the above defined active agent together with one or more acceptable carriers or 30 excipients and optionally other therapeutic ingredients. The carrier(s) must be

M183-2

59

acceptable in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient.

5 The formulations include those suitable for rectal, nasal, topical (including buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular, intravenous and intradermal) administration, but preferably the formulation is an orally administered formulation. The formulations may conveniently be presented in unit dosage form, e.g. tablets and sustained release capsules, and may be prepared by any methods well known in the art of pharmacy.

10 Such methods include the step of bringing into association the above defined active agent with the carrier. In general, the formulations are prepared by uniformly and intimately bringing into association the active agent with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product. The invention extends to methods for preparing a pharmaceutical composition comprising  
15 bringing a compound of Formula I or VI or its pharmaceutically acceptable salt in conjunction or association with a pharmaceutically acceptable carrier or vehicle. If the manufacture of pharmaceutical formulations involves intimate mixing of pharmaceutical excipients and the active ingredient in salt form, then it is often  
20 preferred to use excipients which are non-basic in nature, i.e. either acidic or neutral. Formulations for oral administration in the present invention may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active agent; as a powder or granules; as a solution or a suspension of the active agent in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water in oil liquid emulsion and as a bolus etc.

25 With regard to compositions for oral administration (e.g. tablets and capsules), the term suitable carrier includes vehicles such as common excipients e.g. binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, polyvinylpyrrolidone  
30 (Povidone), methylcellulose, ethylcellulose, sodium carboxymethylcellulose, hydroxypropylmethylcellulose, sucrose and starch; fillers and carriers, for example

corn starch, gelatin, lactose, sucrose, microcrystalline cellulose, kaolin, mannitol, dicalcium phosphate, sodium chloride and alginic acid; and lubricants such as magnesium stearate, sodium stearate and other metallic stearates, stearic acid, glycerol stearate, silicone fluid, talc waxes, oils and colloidal silica. Flavouring agents  
5 such as peppermint, oil of wintergreen, cherry flavouring or the like can also be used. It may be desirable to add a colouring agent to make the dosage form readily identifiable. Tablets may also be coated by methods well known in the art.

A tablet may be made by compression or moulding, optionally with one or more  
10 accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active agent in a free flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid  
15 diluent. The tablets may be optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active agent.

Other formulations suitable for oral administration include lozenges comprising the active agent in a flavoured base, usually sucrose and acacia or tragacanth; pastilles  
20 comprising the active agent in an inert base such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active agent in a suitable liquid carrier.

The compounds of formula I or VI can form salts which form an additional aspect of the invention. Appropriate pharmaceutically acceptable salts of the compounds of  
25 formula I include salts of organic acids, especially carboxylic acids, including but not limited to acetate, trifluoroacetate, lactate, gluconate, citrate, tartrate, maleate, malate, pantothenate, isethionate, adipate, alginate, aspartate, benzoate, butyrate, digluconate, cyclopentanate, glucoheptanate, glycerophosphate, oxalate, heptanoate, hexanoate, fumarate, nicotinate, palmoate, pectinate, 3-  
30 phenylpropionate, picrate, pivalate, proprionate, tartrate, lactobionate, pivate, camphorate, undecanoate and succinate, organic sulphonic acids such as

M183-2

61

methanesulphonate, ethanesulphonate, 2-hydroxyethane sulphonate, camphorsulphonate, 2-naphthalenesulphonate, benzenesulphonate, p-chlorobenzenesulphonate and p-toluenesulphonate; and inorganic acids such as hydrochloride, hydrobromide, hydroiodide, sulphate, bisulphate, hemisulphate, thiocyanate, persulphate, phosphoric and sulphonic acids.

Prodrugs of the compounds of formula I are those compounds which following administration to a patient release a compound of the formula I in vivo generally following hydrolysis in the gut, liver or plasma. Typical prodrugs are pharmaceutically acceptable ethers and especially esters (including phosphate esters) of hydroxy functions, pharmaceutically acceptable amides or carbamates of amine functions or pharmaceutically acceptable esters of carboxy functions. Preferred pharmaceutically acceptable esters include alkyl esters, including acetyl, ethanoyl, butyryl, t-butyryl, stearyl and pivaloyl, phosphate esters and sulphonic esters (ie those derived from  $\text{RSO}_2\text{OH}$ , where R is lower alkyl or aryl). Pharmaceutically acceptable esters include lower alkyl ethers and the ethers disclosed in WO00/47561, especially methoxyaminoacyl and ethoxyaminoacyl.

The compounds of the invention have various steric centres and the invention extends to racemates and enantiomers at each of these steric centres.

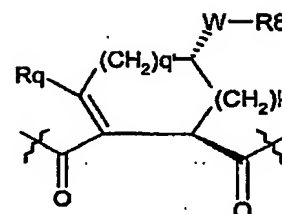

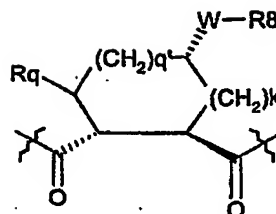

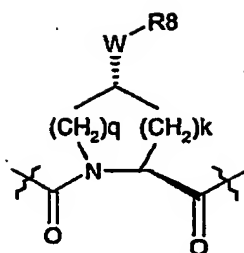

Typically, the stereochemistry of the groups corresponding to the P3 and P4 side chains (ie  $\text{R}^{15}$  and/or  $\text{R}^{11}$ ) will correspond to an L-amino acid configuration, although the invention also extends to D-isomers at one or both of these centres.

The stereochemistry of the backbone component of the cyclic P2 group (i.e. spanning the carbonyl of the P1 amide bond and the carbonyl or E extending of P3 will typically correspond to L-proline. The stereochemistry of the P2 ring atom to which W is bonded is typically as shown:

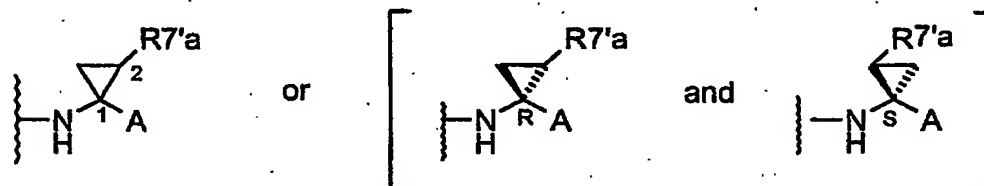

M183-2

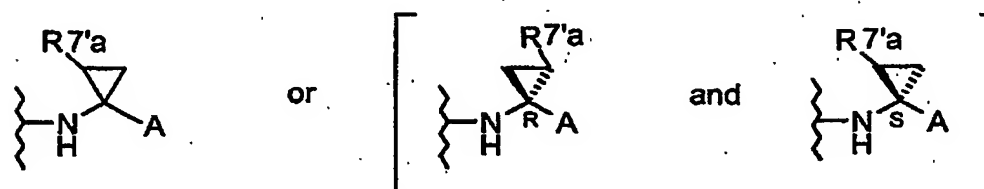

62

In compounds of the invention wherein R7 and R7' together define a spiroalkyl group, such a spiro-cycloalkyl will typically comprise an R<sup>7'a</sup> substituent on the spiro-cyclopropyl ring which is is orientated syn to A:

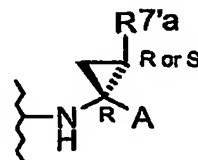

or anti to A:

10

Conveniently, the spiro carbon of such a spiro-cyclopropyl ring has the R configuration:

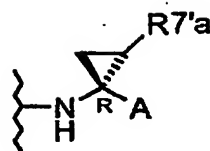

15

Conveniently an R<sup>7'a</sup> substituent on a spiro-cyclopropyl ring adjacent to A is in a syn orientation in the following absolute configuration:

M183-2

63

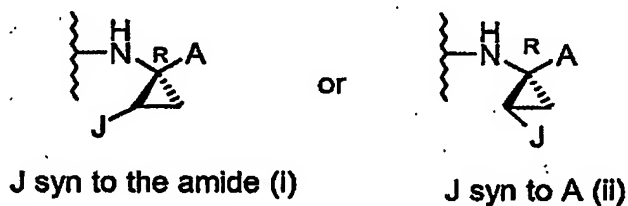

Particularly preferred variants have  $R^{7'a}$  include ethyl, hence the asymmetric carbon atoms at position 1 and 2 have the R, R configuration.

5

Alternative preferred  $R^{7'a}$  include vinyl, hence the asymmetric carbon atoms at position 1 and 2 have the R, S configuration.

Where the compound of the invention is a macrocycle comprising a J group, J is preferably a diastereomer represented by partial structures (i) or (ii):

especially where J is syn to A.

25

To a stirred round bottled flask with toluene (100 mL) ethyl benzoyl acetate (18.7 g, 97 mmol) and *m*-anisidine (12 g, 97 mmol) was added. 4 M HCl in dioxane (0.5 mL) was added and the reaction mixture was refluxed for 6 h (140 °C). The mixture was

### General procedure 2 for the preparation of compounds 174-176

20

To a solution of the sulphonyl chloride (0.075 mmol) in DCM (0.5 ml) was added  $\text{NaHCO}_3$  (s) (60 mg) and a solution of the amine 166 (25 mg, 0.037 mmol) in THF (1 ml). The resulting mixture was stirred at room temperature for 18 hrs, filtered and then shaken with PS-trisamine (tris-(2-aminoethyl)aminomethyl polystyrene, 3.91 mmol/ g, ~50 mg) for 5 hrs.

25

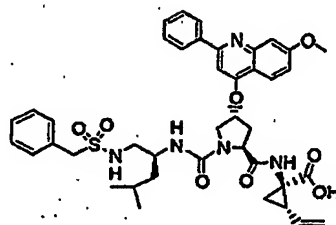

The mixture was filtered and the polymer was washed successively with DCM, THF and methanol. The solid residue resulting from evaporation of the combined filtrates was dissolved in MeOH-THF (2:1, 1.5 ml) and treated with 1 M LiOH (aq) (170  $\mu\text{l}$ ) at 50 °C for reaction times varying from 18 hrs to one week depending on the actual

### Assays

20

The compounds of the invention are conveniently assayed for activity against the NS3 protease of flavivirus such as HCV using conventional in vitro (enzyme) assays or cell culture assays.

25

A useful assay is the Bartenshlager replicon assay disclosed in EP 1043399. An alternative replicon assay is described in WO 03064416.

A convenient enzyme assay involving the inhibition of full-length hepatitis C NS3 is essentially as described in Poliakov, 2002 Prot Expression & Purification 25 363 371. Briefly, the hydrolysis of a depsipeptide substrate, Ac-DED(Edans)EEAbu $\psi$ [COO]ASK(Dabcyl)-NH<sub>2</sub> (AnaSpec, San José, USA), is

5 measured spectrofluorometrically in the presence of a peptide cofactor, KKGSVVIVGRIVLSGK, as described by Landro, 1997 Biochem 36 9340-9348. The enzyme (1 nM) is incubated in a buffer such as 50 mM HEPES, pH 7.5, 10 mM DTT, 40% glycerol, 0.1% n-octyl- $\beta$ -D-glucoside, with 25  $\mu$ M cofactor and inhibitor at say 30 °C for 10 min, whereupon the reaction is initiated by addition of substrate, typically  
10 0.5  $\mu$ M substrate. Inhibitors are typically dissolved in DMSO, sonicated for 30 s and vortexed. The solutions are generally stored at -20°C between measurements.

An alternative enzyme assay is described in WO 0399316 and employs an HCV NS3/4A protease complex FRET peptide assay. The purpose of this in vitro assay is  
15 to measure the inhibition of HCV NS3 protease complexes, derived from the BMS, H77C or J416S strains, as described below, by compounds of the present invention. This assay provides an indication of how effective compounds of the present invention would be in inhibiting HCV proteolytic activity.

20 Serum is taken from an HCV-infected patient. An engineered full-length cDNA template of the HCV genome (BMS strain) was constructed from DNA fragments obtained by reverse transcription-PCR (RT-PCR) of serum RNA and using primers selected on the basis of homology between other genotype Ia strains. From the determination of the entire genome sequence, a genotype Ia was assigned to the  
25 HCV isolate according to the classification of Simmonds et al. (See P Simmonds, KA Rose, S Graham, SW Chan, F McOmish, BC Dow, EA Follett, PL Yap and H Marsden, J.Clin. Microbiol., 31(6), 1493-1503 (1993)). The amino acid sequence of the nonstructural region, NS2-5B, was shown to be >97% identical to HCV genotype Ia (H77C) and 87% identical to genotype Ib (J4L6S). The infectious clones, H77C (I a genotype) and J4L6S (I b genotype) can be obtained from R. Purcell (NIH) and the  
30 sequences are published in Genbank (AAB67036, see Yanagi,M., Purcell,R.H.,

Emerson, S.U. and Bukh. *Proc. Natl. Acad. Sci. U.S.A.* 94 (16) 8738-8743 (1997); AF054247, see Yanagi, M., St Claire, M., Shapiro, M., Emerson, S.U., Purcell, R.H. and Bukh, *Virology* 244 (1), 161 (1998)).

- 5 The BMS, H77C and J4L6S strains are used for production of recombinant NS3/4A protease complexes. DNA encoding the recombinant HCV NS3/4A protease complex (amino acids 1027 to 1711) for these strains were manipulated as described by P. Gallinari et al. (see Gallinari P, Paolini C, Brennan D, Nardi C, Steinkuhler C, De Francesco R. *Biochemistry*. 38(17):562032, (1999)). Briefly, a
- 10 three-lysine solubilizing tail was added at the 3'-end of the 3' NS4A coding region. The cysteine in the P1 position of the NS4A-NS4B cleavage site (amino acid 1711) was changed to a glycine to avoid the proteolytic cleavage of the lysine tag. Furthermore, a cysteine to serine mutation can be introduced by PCR at amino acid position 1454 to prevent the autolytic cleavage in the NS3 helicase domain. The
- 15 variant DNA fragment can be cloned in the pET21b bacterial expression vector (Novagen) and the NS3/4A complex can be expressed in *Escherichia coli* strain BL21 (DE3) (Invitrogen) following the protocol described by P. Gallinari et al. (see Gallinari P, Brennan D, Nardi C, Brunetti M, Tomel L, Steinkuhler C, De Francesco R., *J Virol.* 72(8):6758-69 (1998)) with modifications. Briefly, NS3/4A expression can
- 20 be induced with 0.5mM Isopropyl beta-D thiogalactopyranoside (IPTG) for 22hr at 20°C. A typical fermentation (10 l) yields approximately 80g of wet cell paste. The cells are resuspended in lysis buffer (10 mL/g) consisting of 25mM N-(2-Hydroxyethyl)Piperazine-N'-(2-Ethane Sulfonic acid) (HEPES), pH7.5, 20% glycerol, 500mM Sodium Chloride (NaCl), 0.5% Triton-X100, 1 ug/ml lysozyme,
- 25 5mM Magnesium Chloride (MgCl<sub>2</sub>), 1 ug/ml DnaseI, 5mM beta-Mercaptoethanol (BME), Protease inhibitor - Ethylenediamine Tetraacetic acid (EDTA) free (Roche), homogenized and incubated for 20 mins at VC. The homogenate is sonicated and clarified by ultra-centrifugation at 235000 g for 1 hr at 4°C.
- 30 Imidazole is added to the supernatant to a final concentration of 15mM and the pH adjusted to 8. The crude protein extract is loaded on a Nickel Nitrilotriacetic acid (Ni-

NTA) column pre-equilibrated with buffer B (25mM 20 HEPES, pH8 20% glycerol, 500mM NaCl, 0.5% Triton-X100, 15mM imidazole, 5mM BME). The sample is loaded at a flow rate of 1mL/min. The column is washed with 15 column volumes of buffer C (same as buffer B except with 0.2% Triton-X100). The protein is eluted with 5 column volumes of buffer D (same as buffer C except with 200mM imidazole).

NS3/4A protease complex-containing fractions are pooled and loaded on a desalting column Superdex-S200 pre-equilibrated with buffer D (25mM HEPES, pH7.5, 20% glycerol, 300mM NaCl, 0.2% Triton-X100, 10mM BME). Sample is loaded at a flow rate of 1mU/min. NS3/4A protease complex30 containing fractions are pooled and concentrated to approximately 0.5mg/ml. The purity of the NS3/4A protease complexes, derived from the BMS, H77C and J4L6S strains, are typically judged to be greater than 90% by SDS-PAGE and mass spectrometry analyses.

15 The enzyme is generally stored at -80°C, thawed on ice and diluted prior to use in assay buffer. The substrate used for the NS3/4A protease assay, is conveniently RET S 1 (Resonance Energy Transfer Dipeptide Substrate; AnaSpec, Inc. cat # 22991)(FRET peptide), described by Tallani et al. in Anal. Biochem. 240(2):6067 (1996). The sequence of this peptide is loosely based on the NS4A/NS4B natural cleavage site except there is an ester linkage rather than an amide bond at the cleavage site. The peptide substrate is incubated with one of the three recombinant NS3/4A complexes, in the absence or presence of a compound of the present invention, and the formation of fluorescent reaction product was followed in real time using a Cytofluor Series 4000. Useful reagents are as follow: HEPES and Glycerol (Ultrapure) can be obtained from GIBCO-BRL. Dimethyl Sulfoxide (DMSO) is obtained from Sigma. Beta-Mercaptoethanol is obtained from Bio Rad.

Assay buffer: 50mM HEPES, pH7.5; 0.15M NaCl; 0.1% Triton; 15 % Glycerol; 10mM BME. Substrate: 2 uM final concentration (from a 2mM stock 20 solution in DMSO stored at -20°C). HCV NS3/4A type Ia (Ib), 2-3 nM final concentration (from a 5uM stock solution in 25mM HEPES, pH7.5, 20% glycerol, 300mM NaCl, 0.2%

Triton-X100, 10mM BME). For compounds with potencies approaching the assay limit, the assay can be made more sensitive by adding 50 ug/ml BSA to the assay buffer and/or reducing the end protease concentration to 300 pM.

- 5 The assay is conveniently performed in a 96-well polystyrene black plate from Falcon. Each well contains 25ul NS3/4A protease complex in assay buffer, 50ul of a compound of the present invention in 10% DMSO/assay buffer and 25ul substrate in assay buffer. A control (no compound) is also prepared on the same assay plate. The enzyme complex is mixed with compound or control solution, typically for 1 min
- 10 before initiating the enzymatic reaction by the addition of substrate. The assay plate is generally read immediately using a spectrophotometer such as a Cytofluor Series 4000 (Perspective Biosystems). The instrument is conveniently set to read an emission of 340nm and excitation of 490nm at 25°C. Reactions are generally followed for approximately 15 minutes.

- 15 The percent inhibition can be calculated with the following equation.

$$100 - [(dF_{inh}/dF_{con}) \times 100]$$

- where dF is the change in fluorescence over the linear range of the curve. A
- 20 nonlinear curve fit is applied to the inhibition-concentration data, and the 50% effective concentration (IC<sub>50</sub>) is calculated by the use software such as Excel XI-fit software using the equation:

$$y = A + ((B - A) / (1 + ((C/x)^D)))$$

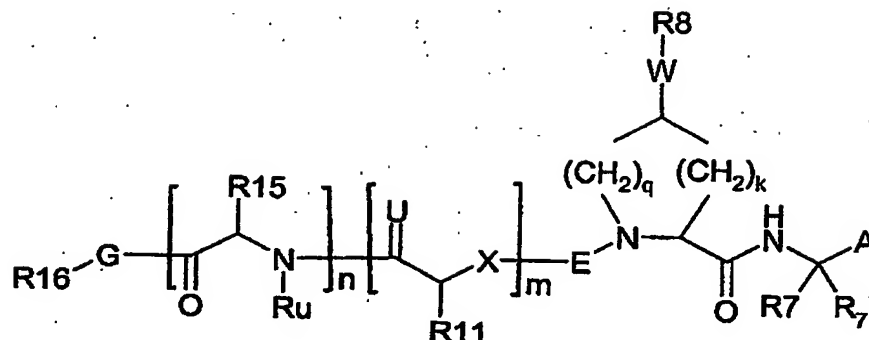

- 25 Various compounds of the invention exemplified above displayed IC<sub>50</sub>s in the range 1nM to 6.9 micromolar and ED<sub>50</sub>s in the sub-micromolar to micromolar range.

**Abstract of the Disclosure**

- Peptidomimetic compounds are described which inhibit the NS3 protease of the
- 5 hepatitis C virus (HCV). The compounds comprise a novel linkage between a carbocyclic or heterocyclic P2 unit and those portions of the inhibitor more distal to the cleavage site, which linkage which reverses the orientation of peptidic bonds on the distal side relative to those proximal to the cleavage site.
